6-3 查询会议列表分页数据(后端)

140.143.132.225:8000/project-1/doc-101

一、业务分析

每个员工只能看到自己参与的会议记录,自己不参与的会议是看不到的。而且会议必须是未开始 状态,或者进行中状态才能被看到,已经结束的会议、审批中的会议、审批不通过的会议都是无 法被看到的。

二、编写持久层代码

在 TbMeetingDao.xml 文件中编写分页查询的SQL语句

```
1. <select id="searchMyMeetingListByPage" parameterType="HashMap" resultType="HashMap">
  2.
         SELECT
   3.
             m.id,
  4.
             m.uuid,
  5.
             m.title,
  6.
             u2.name,
  7.
             DATE_FORMAT(m.date,'%Y年%m月%d日') AS date,
             m.place,
             DATE FORMAT(m.start, '%H:%i') AS start,
  9.
             DATE_FORMAT(m.end, '%H:%i') AS end,
 10.
 11.
             m.type,
 12.
             m.status,
 13.
             m.desc,
 14.
             u2.photo,
             TIMESTAMPDIFF(HOUR, CONCAT(m.date, " ", m.start), CONCAT(m.date, " ", m.end)) AS hour
 15.
 16.
         FROM tb_meeting m
         JOIN tb_user u1 ON JSON_CONTAINS ( m.members, CAST( u1.id AS CHAR ) )
 17.
 18.
         JOIN tb_user u2 ON m.creator_id = u2.id
 19.
         WHERE u1.id = #{userId} AND m.status IN(3,4)
               AND u1.status = 1 AND u2.status = 1
 20.
         ORDER BY m.date, m.start, m.id
 21.
 22.
         LIMIT #{start},#{length}
 23. </select>
在 TbMeetingDao.java 接口中定义Dao方法
  1. @Mapper
  2. public interface TbMeetingDao {
         public ArrayList<HashMap> searchMyMeetingListByPage(HashMap param);
  4.
   5. }
三、编辑业务层代码
在 MeetingService.java 中添加抽象分页方法
```

```
1. public interface MeetingService {
2.
       public ArrayList<HashMap> searchMyMeetingListByPage(HashMap param);
4. }
```

在 MeetingServiceImpl.java 中添加分页方法

```
1. public class MeetingServiceImpl implements MeetingService {
 2.
 3.
        @Override
        public ArrayList<HashMap> searchMyMeetingListByPage(HashMap param) {
 4.
 5.
            ArrayList<HashMap> list = meetingDao.searchMyMeetingListByPage(param);
            String date = null;
 6.
 7.
            ArrayList resultList = new ArrayList();
            HashMap resultMap = null;
9.
            JSONArray array = null;
            for (HashMap map : list) {
10.
11.
                String temp = map.get("date").toString();
12.
                if (!temp.equals(date)) {
13.
                    date = temp;
14.
                     resultMap = new HashMap();
                     resultList.add(resultMap);
15.
16.
                    resultMap.put("date", date);
17.
                    array = new JSONArray();
18.
                    resultMap.put("list", array);
19.
                }
20.
                array.put(map);
21.
22.
            return resultList;
23.
        }
24. }
```

四、编写Web层代码

创建 SearchMyMeetingListByPageForm.java 封装分页请求数据

```
    @ApiModel
    @Data
    public class SearchMyMeetingListByPageForm {
    @NotNull
    @Min(1)
    private Integer page;
    @NotNull
    @Range(min = 1,max = 40)
    private Integer length;
```

创建 MeetingController.java 类,添加分页查询Web方法

```
    @RestController

 2. @RequestMapping("/meeting")
 3. @Api("会议模块网络接口")
4. public class MeetingController {
        @Autowired
        private JwtUtil jwtUtil;
 6.
7.
       @Autowired
        private MeetingService meetingService;
        @PostMapping("/searchMyMeetingListByPage")
9.
10.
       @ApiOperation("查询会议列表分页数据")
        public R searchMyMeetingListByPage(@Valid @RequestBody SearchMyMeetingListByPageForm
11.
   form, @RequestHeader("token") String token) {
12.
            int userId = jwtUtil.getUserId(token);
13.
            int page = form.getPage();
14.
            int length = form.getLength();
15.
            long start = (page - 1) * length;
16.
            HashMap map = new HashMap();
17.
            map.put("userId", userId);
18.
            map.put("start", start);
            map.put("length", length);
19.
            ArrayList list = meetingService.searchMyMeetingListByPage(map);
20.
21.
            return R.ok().put("result", list);
22.
        }
23. }
```
